Xu L, et al. The formation of small particles of a substance with a narrow size distribution is an important process in the pharmaceutical and other industries. Archived from the original on 5 October

This line was first identified experimentally by Nishikawa and Tanaka¹⁷ and Activated processes with different activation energies determine the diffusion in the liquid-like and gas-like regions. The presence of this unique transition behavior emphasizes the complexity of the supercritical state to be expected in high-order mixtures of practical relevance. Dispatched from the UK in 3 business days When will my order arrive? Nuclear En supercritical region in mixtures can therefore no longer be considered as an indistinguishable homogeneous fluid phase, but rather as a complex state space where components transition from a liquid-like to a gas-like state either simultaneously or separately, giving rise to a multifaceted state space.
