Open in a separate window. The standard approach to diagnosis of a suspicious mass is core needle biopsy—several cores should be taken to maximise diagnostic yield. Management 1 Surgery is the standard treatment for all patients with localised STS.

It is recommended that patients with low grade tumours should be followed up. Once the diagnosis of STS was confirmed by results of biopsy or review of outside histological findings, staging was completed with a CT scan of the chest. There is specific guidance on the management of retroperitoneal and uterine sarcomas. Inhibitors of MDM2 have been examined in clinical trials and are associated with significant rates of grade 3 toxicities and few responses.

In general, high-grade tumours tend to recur relatively quickly with over half option is treating with radiation therapy after surgery.
